

Portal Configuration :

This section displays the list of internal portal pages configured in UniBox. Since we have different controllers, each of this portal is assigned to a controller. Multiple portals can be associated to a single controller profile. But at a given time only one of them could be in active state. Each entry contains the name of the Portal, Controller and the URL.

Please note that the portals are hosted inside UniBox so these portals are not accessible from outside UniBox. To access them from remote site, one needs to change the domain name of the portal with the public IP of UniBox.

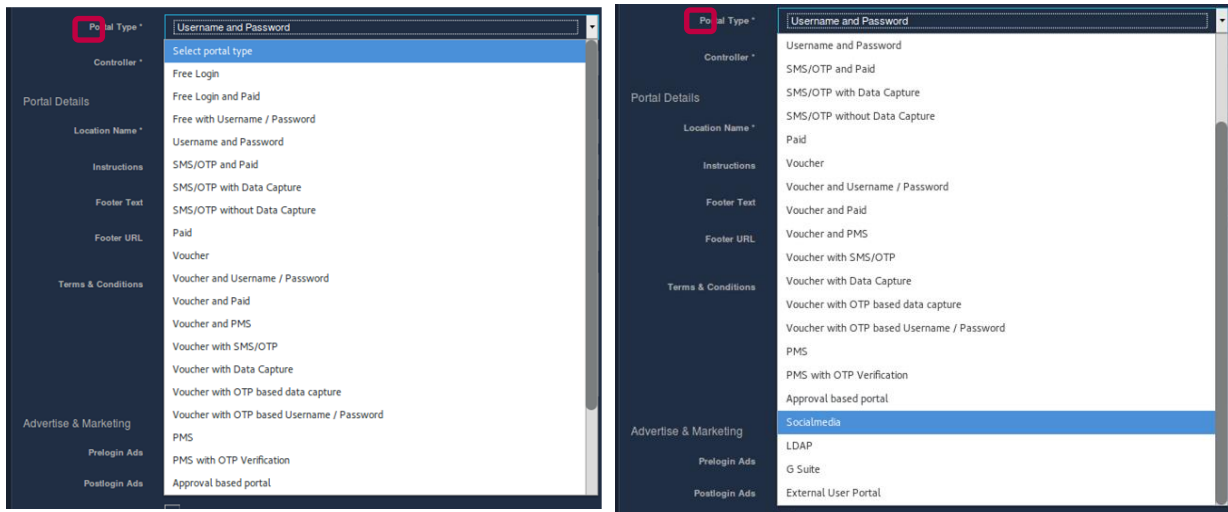

Step I : Adding a New portal

1. Goto **Authentication --> Portals** & add a new portal, as shown below

2. Portal Types :

List of available standard portals.

3. Fill all details and click on “**Submit & Preview**”, your portal would be created.
